CONFIDENTIAL SECRET

The AS-3 proved itself capable of transmitting excellent Morse characters, and several messages were practically error-free. The coder's unreliability made it impossible, however, to maintain low error rates in the field transmission.

- 6. The absence of AVC in the RR/D-11 was a handicap in copying Hellschreiber because of the narrow dynamic range of the TP-3. After the receiver and TP-3 gain controls had been adjusted for good printing, normal transmission fading, for which the RR/D-11 does not compensate, resulted in blank spots in the tape. At first we tried to catch every character by "riding gain" on these fades, but operator over-adjustment was soon found to be a much more serious factor in tape errors than normal fades or interference bursts. Since the base station transmitted its traffic from looped tapes, it became standard practice for the field to copy 3 or 4 runs on the TP-3 before breaking with a QSL. Side-by-side comparison of successive runs, (which matched up readily since the tapes were all the same length) allowed the operator to ignore fading, interference or printed garbles on one run by picking up the correct text at the same spot on another.
- 7. Both stations were most anxious about the status of the reusable TP-3 tape and felt that the operational usefulness of the TP-3 would be greatly increased when reusable water washable tape is available. The field was promised sample tape rolls and ink as soon as they are received. Insertion of tape into both TP-3 units was extremely difficult and time consuming, and the field requested that a better method be investigated for threading tape into the TP-3.
- 8. The RR/D-11 receivers had poor resettability on Band II and poor calibration accuracy on both bands. Errors as high as 30 kc in dial calibration were noted. The excellent sensitivity, battery economy and small size of the receiver, however, were subjects of favorable comment at both . The SP/SA group at used an RR/D-11 on a field problem and returned with high praise for its performance.

| both CV-13*s, due perhaps to internal misalignment or narrow signal filters, the RBR-13 was used, with excellent results, at is | 50X ² |
|---|------------------|
| awaiting instructions regarding the disposition or repair of its two CV-13's. On the other hand, no difficulty whatever was encountered at with the CV-13. Both stations criticized the ON-OFF labelling of the standby switch which must be turned to OFF for normal operation. A return to "STANDBY-OPERATE" as used in the RBR-13 was suggested. The CV-13 was very well | 50X |
| received at where it is finding continuous use on high-speed training circuits. It is considered by the field to be a marked improvement over the RBR-13 but it is the writer's opinion that fuller operator familiarity with the CV-13 is responsible in large part for its better reputation. | 50X ⁻ |
| 10. Informal discussions with personnel resulted in the following field suggestions for improving the AS-3: | 50X ⁻ |
| a. The CO-3 coders used in these tests were both faulty, and there was unanimous agreement that their operation should be improved. favors a coder which the skilled operator can use more rapidly than the CO-3, and would like to see, as an accessory unit for the system, an AS-3 coder with a straight Morse key used as the input device. | 50X ⁻ |
| b. It became apparent early in the tests that tuning the AS-3 in to a new frequency or antenna took longer than transmitting a full 125-group message. I requested we investigate a very low power TUNE position, or a high speed crank or slider for turning the pi-output inductor. With the recessed thumbscrew presently used, it takes at least 60 seconds to search the full inductance range for maximum output. | 50X ⁻ |
| c. Both stations recommended that break-in be provided in production AS-3's to simplify the operation of the system. The SEND-RECEIVE switch now used makes conventional Morse operation awkward, and appeared to to be an unnecessary additional step in automatic operation. | 50X ⁻ |
| d. recommends an accessory cable which would permit an operator to assemble only his receiver, printer and power source for receiving blind broadcasts. | 50X ⁻ |
| e. inquired whether a small 60-cycle filter box could be built to plug between the BC-3 battery charger and the RR/D-11 for AC operation of the receiver. The BC-3 provides 12 vdc from 70 to 270 vac but contains no hum filters. | 50X ⁻ |
| asked whether a burial container had been designed for the AS-3. The BC series of containers were said to be highly satisfactory for caching the RS-1 and RS-6. | 50X1 |
